

## Google Machine Learning Crash Course

### Linear Regression

- Predicting continuous numerical values.
- Understanding the relationship between input features and output.
- Learning how a model improves using training data.
- Introduction to gradient descent and loss functions.

### Logistic Regression

- Performing binary classification tasks.
- Using the sigmoid function to generate probabilities.
- Understanding decision boundaries.
- Learning about log loss and regularization.

## **Classification**

- Classifying data into different categories.
- Understanding false positives, false negatives, true positives, and true negatives.
- Learning about classification thresholds.
- Evaluating models using accuracy, precision, recall, ROC curve, and AUC.

## **Overall Learning**

Completing this Machine Learning Crash Course gave me a strong foundation in the basic concepts of machine learning. I learned how regression and classification models are used to make predictions, how they are trained and optimized, and how their performance is evaluated using different metrics. This course improved my understanding of core machine learning concepts and their practical applications.
